

Features and Functionality

My website includes a home, news, and store pages for a main “Dark Ops” game and a secondary “Future Ops” game. All pages have been enhanced by the dynamic styles and JavaScript Bootstrap provides. All pages include a navbar with links and a dynamic dropdown menu when the page is a smaller width. All pages also include a footer with a link to a code of conduct page.

The main page features A background gif and a game with a description and buy button that was inspired by the Call of Duty: Black Ops 6 main webpage (<https://www.callofduty.com/blackops6>).

The news page features a filter for types of news as well as bootstrap-powered cards that display the news summaries. The cards linked to separate news pages for the whole news story.

The store pages for Dark Ops and Future Ops featured a description of the game as well as a buy button that lets you know if the purchase was successful.

How JavaScript Enhances the User Experience

Some JavaScript was introduced through the dynamic features of Bootstrap. The navbar is dynamic and can be a dropdown or display all links depending on page size. Buttons are highlighted when hovered over, letting the user know they can click it.

The other JavaScript was written by me. There are filters for the news pages to see a certain type which lets the user narrow their options if they choose. The buy buttons on the store pages also let the user know if they have purchased the game.

Challenges I Faced and How I Overcame Them

The first challenge I faced was learning how to use Bootstrap. I did not have much experience with Bootstrap, so I had to do extensive research on their website. I overcame this challenge by using videos and the Bootstrap website to help me with all the dynamic features and styling.

The second challenge I faced was time. The website featured several pages with their own features. I overcame this challenge by relying more on the dynamic JavaScript and styles Bootstrap provided and using less of my own JavaScript to save some time.

Plans For Additional Features or Backend Integration

I plan on implementing a login feature in the future for people who would like to create an account.

I would also like to implement a real purchase system and cart in the future.

Sketch for final project
